1 Bernstein Polynomial

Bernstein basis polynomial of degree n are

$$B_{i,n}(t) = \binom{n}{i} t^i (1-t)^{n-i} \quad , (t \in [0, 1], \quad i = 1, \dots, n)$$

Bernstein polynomial of degree n is

$$B_n(t) = \sum_{i=0}^n \beta_i B_{i,n}(t)$$

where β_i is called Bernstein or Bezier coefficient.

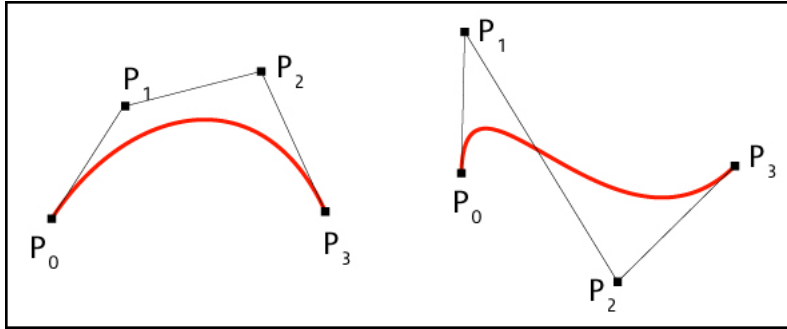

Bernstein polynomial can approximate any continuous function on $[0, 1]$.

$$B_n(f)(t) = \sum_{i=0}^n f\left(\frac{i}{n}\right) B_{i,n}(t)$$

and

$$\lim_{n \rightarrow \infty} B_n(f)(t) \xrightarrow{\text{uniformly}} f(t)$$

2 Bezier Curve

Given $n + 1$ control points, P_1, \dots, P_n , a bezier curve is defined by

$$C(t) = \sum_{i=0}^n P_i B_{i,n}(t)$$

$C(t)$ always passes through the first and the last control point and its tangent at $C(t_0)$ and $C(t_n)$ are $\overrightarrow{P_0 P_1}$ and $\overrightarrow{P_{n-1} P_n}$ respectively.

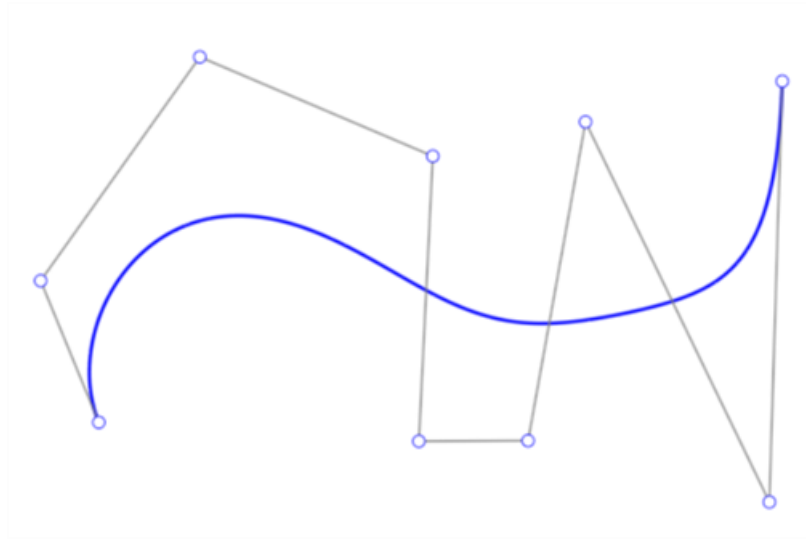

图 1: Bezier curve with more control points

3 B-Spline

B-Spline is a generalization of Bezier curve. Given a knot vector

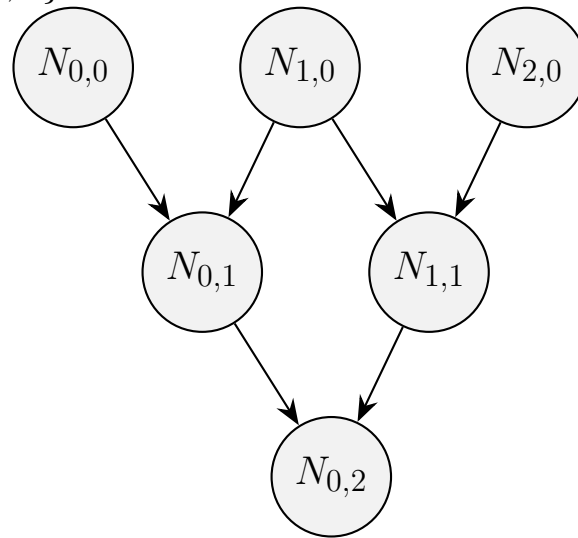

$$T = \{t_0, \dots, t_m \mid t_i \in [0, 1], t_i \leq t_{i+1}\}$$

We can build B-Spline basis $N_{i,j}$ by bottom up recursion defined by

$$N_{i,0}(t) = \begin{cases} I_{[t_i, t_{i+1}]}(t) & , \text{ if } t_i \neq t_{i+1} \\ 0 & , \text{ otherwise} \end{cases}$$

$$N_{i,j}(t) = \frac{t - t_i}{t_{i+j} - t_i} N_{i,j-1}(t) + \frac{t_{i+j+1} - t}{t_{i+j+1} - t_{i+1}} N_{i+1,j-1}(t)$$

For example, if $T = \{0, 1, 2, 3\}$, we can build the basis from bottom up recursively

We ended up with

$$N_{0,1} = tI_{[0,1]} + (2-t)I_{[1,2]}$$

$$N_{1,1} = (t-1)I_{[1,2]} + (3-t)I_{[2,3]}$$

$$N_{0,2} = \frac{t^2}{2}I_{[0,1]} + \frac{(6t-2t^2-3)}{2}I_{[1,2]} + \frac{(3-t)^2}{2}I_{[2,3]}$$

With control points C_0, \dots, C_n , we can define the degree of B-spline $D = m - n - 1$. And the B-spline is defined by the basis as

$$C(t) = \sum_{i=0}^D C_i N_{i,D}(t)$$

Often times, control points are not given, instead we need to fit a B-spline to points $(P_0, t_0), \dots, (P_r, t_r)$. Instead we solve for C_i ,

$$P_i = C(t_i) = \sum_{j=0}^D C_j N_{j,D}(t_i) \Rightarrow P = CN$$
